Why would we want to limit the satellite radio stations? Especially when providing a public service such as weather and traffic. Even though I have XM I still listen to commercial radio as well. I let the show content determine my listening patterns. I can't see how a traffic / weather report on the satellite can do anything other than serve the public interest. For gosh sakes, we've not dealt with "shock jocks" for years. I think developing a policy for shock jocks is of much more importance than protecting commercial radios' reporting of traffic and weather. (PS: while I'm personally opposed to some of the content of "shock jock" radio, I do believe the listener has the ultimate control of what is on the radio waves. We can simply turn it off!)
